

Conceptual Model Assignment Answer Guide

Below is a depiction of the SurfReport System by way of a domain model and package diagram. *There is not necessarily a single correct answer. Answers are considered in the context of how useful they are. An analysis and design solution should try to capture the 'major, obvious' points, and attempt to clearly communicate what is important to know about the problem and its solution.* With this, grading was primarily based on the following criteria:

- Candidate Concepts
 - Use of either the conceptual category list or noun phrase list identification techniques to identify concepts
 - Table or other listing structure depicting list of concepts
- Domain Model
 - Layout of classes
 - Class associations with other classes
 - Class multiplicity and aggregation
 - Class method and attribute definitions (not necessary to be complete as this is a conceptual model)

- Package Diagram
 - Logical grouping of classes
 - Proper usage of relationships between packages (includes / extends)
